AP PRECALCULUS

Unit 1 • Lesson 1.13-1.14 • Guided notes

Topic 1.13-1.14 • Function Model Construction

Guided notes • Fill in the blanks and work the examples in the boxes

Learning goals

- Choose an appropriate function type for data or a context, and state the assumptions.
- Build models from geometric or verbal descriptions, and from data with regression.
- Use models to predict and interpret, with units and a sensible domain.

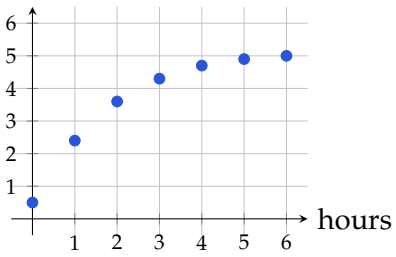

Vocabulary. model, linear, quadratic, cubic, rational, piecewise, regression, assumption, restricted domain, extrapolation.

1. Choosing a model

Key idea

Roughly constant rate of change	_____
Constant second differences; one maximum or minimum	_____
Two turning points or a change in concavity	_____
Approaches a limiting value; "per unit" quantities	_____
Different rules on different intervals	_____

Example 1 • Which model?

The concentration of a medicine rises, then levels off near 5. Which model fits?

2. Assumptions and domain

Every model assumes the pattern _____. Restrict the domain to inputs that make sense in context (for example, time ≥ 0, lengths _____). Predictions far outside the data (_____) are less reliable.

3. Building a model from a description

Example 2 • Optimization

A farmer has 60 m of fence for a rectangular pen along a wall (no fence on the wall side). Model the area and find the largest area.

Example 3 • Piecewise

A phone plan costs \$20 per month including 100 texts, plus \$0.10 per extra text. Write $C(n)$ and find $C(250)$.

4. Building a model from data

Example 4 • Regression (calculator)

A ball's height (m) at $t = 0, 1, 2, 3, 4$ s is $1.2,\ 6.1,\ 9.0,\ 9.9,\ 8.6$. Find a quadratic model and predict the height at $t = 5$.

AP exam tip

Keep regression coefficients stored in the calculator and round only the final answer (three decimal places). Always state units and the meaning in context.

Common mistakes

- Leaving two variables in a model: use the constraint to eliminate one.
- Using a model for inputs outside its domain (negative times, negative lengths).

Check your understanding

1. "The value drops by \$1200 each year" suggests a _____ model.
2. A box with a square base of side x and volume 32 has height _____.
